Personal Area Networks: provide protected personal networks for your users

The Personal Area Network (PAN) Add-On for the Intello Cloud Portal allows users to benefit from your Wi-Fi network the same way they would in their own homes: all of their personal devices can communicate with one another and are still protected from other users without the need for a SSID per room or apartment. Intello's unique solution takes it one step further by allowing you to share building-owned devices to individual users, such as a smart tv, casting device or wireless printer in a furnished room. When deployed with a compatible network that supports per-user PSK, our solution provides next-generation personal area networks and per-user WPA2 WIFI encryption without creating and managing dedicated SSIDs for each user. The Intello Cloud portal login credentials can be matched to the unique WPA2 encryption key for simplicity.

Personal Area Networks = Enforced security
